WEATHER SYNOPSIS BY REGION

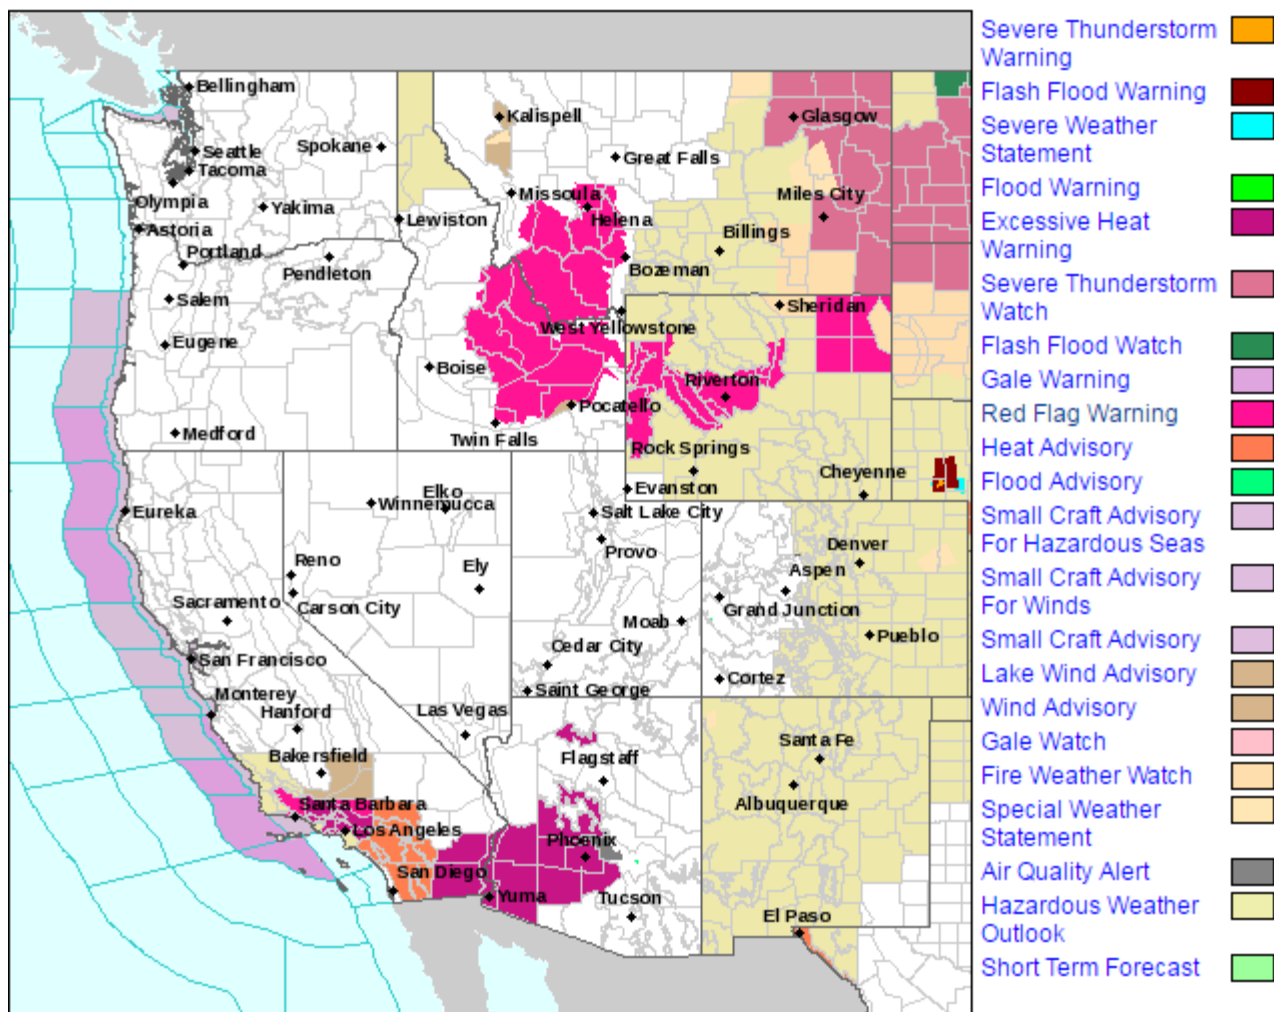

NORTHERN CALIFORNIA

The low pressure trough that has been producing cooler than normal temperatures and breezy conditions across Northern California is moving off to the east this morning. High pressure will build over Southern CA and the Eastern Pacific over the next few days, but a weak low pressure trough will remain over Northern California. Temperatures throughout the region will warm to near normal today, and slightly above normal Saturday through Monday, but without the weak trough temperatures would be even warmer. Beginning Tuesday the high pressure ridge will push over Northern California and temperatures will increase further. Afternoon highs around 110 may become possible in the warmest inland valleys by the middle of next week. Afternoon RH and overnight RH recovery will drop to poor to low-end moderate values in a lot of areas during much of the 7-Day period. The coastal marine layer will also be shallow and only affect areas near the immediate coast during this time. A north to northeast downslope surface wind pattern can be expected in and around the Sacramento Valley during nights and mornings, but afternoon winds will mostly be light upslope inland and moderate onshore near the coast. Beginning around Day 7 computer models are indicating a chance that subtropical moisture could move northward into the region and cause isolated to scattered dry thunderstorms. Confidence in this pattern change is low so far and it will be closely monitored.

SOUTHERN CALIFORNIA

A north to south surface pressure gradient is already producing gusty winds across Santa Barbara County and the I-5 Corridor early this morning. Some wind gusts over 25 mph have been occurring at Refugio and in northern Los Angeles County since midnight. Expect these winds to increase throughout the day, and after sunset this evening, some wind gusts over 50 mph will be possible. Across the Kern County Mountains, northwest winds of 15-25 mph with gusts to near 40 mph will develop by afternoon. The heatwave will peak in intensity today with highs reaching the mid to upper 80s at the coast and in the mountains above 5,000 feet, 110 in the valleys and close to 120 in the low desert. All areas, except for the highest elevations, will see minimum RH fall into the 8-12% range. Tonight, winds over the Kern County Mountains will decrease, but expect some wind gusts to 40 mph throughout the overnight hours in Santa Barbara County and the I-5 Corridor. The winds in these areas will slowly taper off Saturday afternoon. An onshore pressure gradient will bring some cooling to the coast and intermediate valleys Saturday, but temperatures will remain very hot inland. Much cooler weather will overspread the area Sunday and Monday with temperatures likely returning to near normal readings by Tuesday. Expect much less wind for Sunday through most of next week. Long range models indicate a surge of monsoonal moisture may arrive during the middle of next week. Scattered wet thunderstorms will be possible over the desert Wednesday which may spread westward to include the San Bernardino and Cleveland National Forests by next Thursday. Minimum RH may be significantly higher by the end of next week.
